Oolite "Cargo canister"

Model Design by Ian Bell and David Braben
Texture by Giles "Aegidian" Williams
Paper Model Mesh by Dave "Selezen" Hughes

All folds are Mountain folds.
It's a simple box model, so I think you
should be able to work out where to glue...

This template can make 2 different types of model. It
can be a simple display model of a cargo container or
it can be made as a box to keep your stuff in (not slaves,
firearms or narcotics please).
Follow the instructions below to make each version.

If making the "box" version, the panel below should be cut around whole and folded
back over the main model panel to reinforce this section (the lid will tuck into the edge
of this bit). If building a display model, cut the panel out to the dotted line to make a tab
which will glue to the "lid" panel.

If making the "box" version, the indicated
tab should be left whole and will be used
to lock the lid in place. If making the
display model, cut out the tab to the
dotted lines.

If making the "box" version, the indicated
tab should be left whole and will be used
to lock the lid in place. If making the
display model, cut out the tab to the
dotted lines.

If making the box version, fold the grey
panels below back over the main model
panel to reinforce the "lid" parts.

If making the box version, fold the grey
panels below back over the main model
panel to reinforce the "lid" parts.

cargopod inc.

If making the box version, cut
around all the grey tabs and
down the red line above until reaching
the main model line as indicated by the arrow.
Make sure you do the same on the other side.
If making the display model just cut these shaded
panels off as they are not needed.

The above tab can be removed
if making the display version.

If making the "box" version, the hatched
area just above (and on the other side)
should be trimmed out so the "lid" can
catch on the side flaps.
